DIEZ

AI for Data Stewards

Session briefs

Purpose of this document

A practical four-day programme for teams who will use, oversee or sign off AI-enabled products.

Prepared for: Dubai Integrated Economic Zones Authority (DIEZ)

Format: Four-day applied programme with pre- and post-assessment

Working environment: Microsoft 365 Copilot on DIEZ laptops; simulated data only; no live-system access

Status: Draft for client consideration · September 2026

1. Programme at a glance

The programme is for business section heads, team managers, data owners and stewards. Participants work in functional teams across DAFZ, DSO and Dubai CommerCity, using the same process so that differences across the three zones can be compared.

Day	Focus	What participants leave with
Day 1	Understand and identify	A shared AI model, safe-use rules, a tested working pattern and an opportunity map.
Day 2	Apply to DIEZ products	A data-readiness checklist, reviewed product artefacts and a prioritised use case.
Day 3	Verify and govern	A safe-use checklist, product risk review, sign-off checklist, human-review workflow and escalation map.
Day 4	Implement and demonstrate	A governed AI-assisted workflow, capstone assessment, post-assessment and 30-day application plan.

Important delivery conditions

Microsoft 365 Copilot is the approved assistant used in the labs. All examples use simulated DIEZ-style data: no real customer data, no financial values and no access to live DIEZ systems. Net session durations are shown below; clock times and breaks are set with DIEZ HR.

2. What participants should be able to do

- Know which governance practices come with a product they are asked to sign off.
- Tell a responsible AI product or output from one that is not, considering privacy, security, bias, human oversight and verification.
- Triage a use case: safe to adopt; adopt only with a human in the loop; or not solvable by AI yet.
- Explain how the quality of the data they own drives the quality of AI built on it.
- Understand DIEZ's seven live AI initiatives and frame new use cases from their own pain points.
- Know the danger of putting sensitive data into non-approved AI tools, and act accordingly.

3. The seven DIEZ products used in the programme

Product	Focus in the sessions
Customer Segmentation	Customer tiers shown in Salesforce; inconsistent customer definitions; missing, duplicated or stale drivers.
Sentiment Analysis	Positive, neutral or negative labels with confidence scores across Arabic and English customer-care text.
Customer Churn Prediction	Alerts intended at least three months ahead; probability versus certainty; human retention decisions.
Content Moderation	Text and image screening in the Dubai CommerCity community app; policy, borderline cases and escalation. Technology remains to be confirmed.
Partner IQ	Matching businesses within the same free zone; matching criteria, ranking fairness and explainability. Technical mechanism remains to be confirmed.
Microsoft 365 Copilot	Safe work in Word, Excel, PowerPoint and Outlook with approved information and verification.
Document Intelligence	OCR extraction from submitted documents, such as visa applications, before information reaches another government portal.

4. Day 1 — Understand and identify

Day purpose: Build a shared, plain-language model of AI through DIEZ's own products, set safe-use rules and select worthwhile opportunities.

No.	Time	Session	Lead	Purpose	Participant activity	Output
1	30 min	Welcome, baseline read-out and learning contract	Softengi with Wellington	Connect the programme to the cohort's confidence, current use and concerns.	Form cross-zone function teams; agree the rules: approved assistant only, simulated data only and verify before use; write personal success criteria.	Success criteria, learning contract and evidence portfolio opened.
2	60 min	AI through DIEZ's seven products	Softengi	Build a practical understanding of grouping, classifying, predicting, matching, extracting and generating.	Map each product's purpose, data, business owner and what a wrong output would look like; compare maps in a gallery walk.	DIEZ product map.
3	45 min	Safe use: approved tools, authorised data and what never to share	Softengi	Help participants decide, in the moment, whether information may be placed in an AI tool.	Sort realistic scenarios into allowed, allowed with conditions and not allowed; name the rule behind each decision.	Draft safe-use decision guide.
4	45 min	Demonstration: from context to verified output	Softengi	Model the full working discipline from instruction through verification.	Spot an unsupported statement, missing condition and invented deadline in a Copilot response; check each claim against the source.	Output-verification checklist and observation notes.
5	75 min	Lab: context and instruction on a stewardship task	Softengi	Show how weak instructions produce weak outputs.	Reconcile three conflicting definitions of a key customer; create a data-dictionary entry in Word and save the tested prompt pattern.	AI working and prompt canvas, tested prompt pattern and draft data-dictionary entry.
6	60 min	Opportunity clinic: safe to adopt, human in the loop or not yet	Softengi	Help participants choose worthwhile opportunities honestly.	Rate recurring tasks for value, data readiness and risk, then sort them into three adoption categories.	AI Opportunity Map with triage column.

5. Day 2 — Apply to DIEZ products

Day purpose: Practise AI-assisted stewardship work and assess data readiness across customer, matching and document workflows.

No.	Time	Session	Lead	Purpose	Participant activity	Output
1	20 min	Recap and challenge: a plausible but unsupported output	Softengi	Re-activate the verification habit.	Find the unsupported statement in a customer-feedback summary and correct it with evidence.	Corrected output note.
2	60 min	Garbage in, garbage out: data readiness for the products you own	Softengi	Show how the quality of owned data sets the ceiling for AI quality.	Assess one dataset for documentation, governance, access, completeness, consistency, currency and representation; compare differences across zones.	AI and Data Readiness Checklist.
3	60 min	Lab A: Customer Segmentation	Softengi	Test whether tiering can be trusted when definitions and drivers are inconsistent.	Profile 300 simulated companies in Excel; find missing drivers, duplicates and stale records; reconcile definitions; challenge two tier assignments.	Segment review and data-readiness notes.
4	75 min	Lab B: Customer Care — Sentiment Analysis and Churn Prediction	Softengi	Work with the two products Customer Care relies on for customer insight and intervention.	Label Arabic and English tickets; set a review threshold; decide what to do with churn alerts; find the alert caused by a data error; verify a leadership-visit brief.	Sentiment validation log and churn intervention control.
5	75 min	Lab C: Document Intelligence and Partner IQ	Softengi	Check extracted information before it reaches another system and question how partner matches are ranked.	Validate OCR fields; write stop-and-check rules; review partner rankings; identify profile fields that affect fair matching.	Extraction QA record, exception workflow and matching-criteria review.
6	45 min	Use-case prioritisation for the capstone	Softengi	Choose the use case each team will carry forward.	Compare candidates on purpose, data readiness, risk and value; select an improvement to an existing product or a new use case.	Prioritised DIEZ use case.

6. Day 3 — Verify and govern

Day purpose: Make responsible-AI controls explicit inside DIEZ's own frameworks and prepare stewards for product sign-off.

No.	Time	Session	Lead	Purpose	Participant activity	Output
1	20 min	Recap: what makes an output trustworthy?	Softengi	Review the previous day's evidence and acceptance decisions.	Swap one product artefact with another team and check the evidence behind the decision.	Peer-review record.
2	60 min	Responsible AI inside DIEZ's frameworks	Softengi	Connect practical risks to DIEZ's data- and AI-governance responsibilities.	Apply privacy, confidentiality, security, bias, explainability, intellectual property, over-reliance and evidence-retention questions to a case.	Risk prompt card.
3	75 min	Sign-off simulation: Digital asks you to sign off this product	Softengi	Prepare participants for the point at which a business owner or steward must accept an AI-enabled product.	Question a release pack about purpose, data, testing, error rate, limitations, human review and monitoring; decide sign off, sign off with conditions or not yet.	Initiative risk review and sign-off checklist.
4	60 min	Lab: Content Moderation	Softengi	Translate community policy into moderation decisions and identify where people must intervene.	Review borderline posts, false positives and false negatives; set the review approach for sensitive cases and design escalation.	Content-moderation risk review and escalation path.
5	45 min	Copilot control patterns	Softengi	Settle the everyday rules for using the approved assistant safely.	Work through cases involving confidential data, unknown document status, missing sources and tasks that should not be delegated.	AI Safe Use Checklist.
6	60 min	Human review, decision rights and escalation	Softengi	Make the human role explicit at every point in the workflow.	Map who checks what, when work stops, what evidence is kept and how concerns move from steward to business leadership and Digital.	Human review workflow, escalation map and governed workflow outline.

7. Day 4 — Implement and demonstrate

Day purpose: Integrate the learning into a governed workflow, demonstrate it and plan workplace application.

No.	Time	Session	Lead	Purpose	Participant activity	Output
1	30 min	Capstone briefing and assessment criteria	Softengi and CMI	Set the capstone task, rubric and presentation format.	Review the evidence expectations and agree the peer-review protocol.	Capstone plan.
2	90 min	Workflow design studio	Softengi	Build an end-to-end governed workflow.	Assemble the team's Day 1–3 artefacts into: input → AI assistance → human review → decision → evidence → action → monitoring.	Draft governed workflow.
3	Set by CMI	Implementation, adoption and change	CMI through Wellington	Connect the workflow to management capability, adoption and change.	Use the draft workflow as the working case for the management and implementation content.	Implementation canvas, if confirmed by CMI.
4	60 min	Peer review and refinement	Softengi and CMI	Challenge and improve each capstone.	Review another team's problem framing, data readiness, controls and value; revise the workflow and presentation.	Peer-feedback record.
5	45 min	Capstone demonstrations	Softengi and CMI panel	Present the governed workflow and explain the responsible-use decisions.	Present the workflow and answer panel questions; the panel scores against the rubric.	Assessed capstone.
6	Set by CMI	Post-assessment, CMI evidence and 30-day application plan	Wellington and CMI	Measure progress and plan the move from classroom to work.	Complete the scenario-based post-assessment and commit to a practical workplace application plan.	Post-assessment, CMI evidence portfolio and 30-day application plan.

8. Materials and evidence participants work with

All materials are fictitious and DIEZ-style. They contain no real customer data and no financial values. Arabic content is reviewed by Arabic-speaking faculty.

Material	What it contains	What participants look for
Customer list	About 300 simulated companies across DAFZ, DSO and Dubai CommerCity.	Missing drivers, duplicates, conflicting definitions and stale records.
Customer tickets	About 200 simulated Arabic and English enquiries and complaints with model label and confidence.	Mixed language, sarcasm, low-confidence and mislabelled cases.
Churn alert list	Simulated customers with lease history, ticket counts and churn probability.	Missing history, data-error alerts and borderline probabilities.
Community posts	Simulated text posts with moderation decisions and a policy excerpt.	False positives, false negatives and exception cases.
Partner matches	Simulated recommendation list with company-profile fields.	Ranking skew towards large members and incomplete profiles.
Application forms	Simulated forms and an extracted-fields table.	Misread fields, missing pages and mismatched names.
Scenario pack	Scenario cards, a policy document, an enquiry, departmental definitions, release packs and simulated mail.	Safe-use choices, unsupported claims, sign-off evidence and escalation.

9. What DIEZ will need to confirm

The programme can be prepared using the working assumptions below, but the client-facing materials should be updated when DIEZ provides its own wording or current product information.

- Participant list, including zone, function and product owned; approximately 20 participants per cohort is assumed.
- DIEZ data-governance and AI-governance framework extracts, including role definitions, data classifications, quality dimensions and acceptable-use guidance. This information is required before Softengi begins developing the course content.
- Screenshots or user-guide pages for each initiative, including the owners currently not stated.
- Representative, appropriately anonymised extracts from relevant real datasets, or sufficiently detailed data profiles where extracts cannot be shared, so that the synthetic course datasets can closely reflect DIEZ's structures, fields, distributions and likely data-quality issues.
- Content Moderation technology and Partner IQ technical mechanism, which remain to be confirmed.
- The Customer Segmentation drivers, tier definitions, refresh frequency and Salesforce display or override process.
- Sentiment and churn output formats, thresholds, monitoring and authorised intervention rules.
- Document types, field-confidence thresholds, exception handling and portal-validation rules for Document Intelligence.
- Product approval, release and risk-assessment procedure, plus escalation routes and decision rights.
- Which UAE or Dubai legal and regulatory references DIEZ wants referenced; the programme does not give legal advice.
- DIEZ reviewers for the capstone panel, if DIEZ wishes to participate in assessment.

Decision requested

Confirm whether the four-day structure, the product labs, the simulated-data environment and the sign-off exercise are suitable as the basis for final faculty preparation. The remaining DIEZ inputs can then be incorporated without changing the overall learning journey.
